

OnMe

Try-on first shopping. Every tile, one tap from a virtual try-on on your own photo.

Perfect Corp APIs powering OnMe: YouCam virtual try-on (jewelry, watches, outfit categories) and YouCam hair color try-on. Every render in the app is generated by a Perfect Corp endpoint, routed per category from a Cloudflare Worker that holds the API credentials and stitches the user's body photo with the product.

What it is

OnMe is a mobile shopping app that solves the fitting-room problem online. You see a piece, you want to know how it looks on *you*, not on a model. Every product (rings, necklaces, earrings, watches, outfits, hair color) is one tap from a virtual try-on rendered on the user's own photo through Perfect Corp's YouCam APIs. The app also includes **Scan**, a Shazam-for-clothes feature that turns any TikTok URL or screenshot into try-on-ready product cards.

1. Curated feed with category chips

2. Product page with Try on me CTA

3. Ring rendered on hand (Perfect Corp YouCam)

Consumer and retail value

Online apparel and accessory returns run roughly 25 to 40 percent industry-wide, mostly because customers can't visualize fit and look before buying. Static product photography and generic models don't solve this.

For shoppers: see yourself in every item before checkout. Decide on jewelry, watches, outfits, even a new hair color, without going to a store or salon.

For retailers: higher conversion at lower cost, fewer returns, richer engagement signals (which renders the user saved, shared, or pushed to bag).

For Perfect Corp: a consumer-side use case that exercises multiple YouCam categories in a single app, with Scan as a discovery loop that drives more renders per session than a typical brand integration.

Perfect Corp API integration

Each product category in the app routes to a different Perfect Corp endpoint with the appropriate body-part hint. The category-to-API mapping:

Rings to YouCam jewelry try-on, hand body part, finger landmark

Necklaces to YouCam jewelry try-on, neck body part

Earrings to YouCam jewelry try-on, ear landmark

Watches to YouCam jewelry try-on, wrist body part

Outfits to YouCam outfit (full-body) try-on

Hair color to YouCam hair color try-on with selectable swatches

Typical try-on round trip is under 8 seconds end to end. The result is non-destructive (the original body photo is preserved) and saved locally with the option to push to the user's saves drawer.

Scan: Shazam for clothes

Scan is the discovery loop. The user pastes a TikTok link, drops a screenshot, or takes a photo. A Cloudflare Worker pulls frames, runs vision over every wearable item, and looks up the real product on the web. The output is a stack of try-on-ready cards: each card has a confidence score, a matched brand listing, a Try OnMe button (back into the Perfect Corp flow), and a Shop the real one deep link to the brand's site.

4. Scan entry: TikTok URL, photo, or screenshot

5. Detected items, confidence, real brand match

6. Hair color try-on (Perfect Corp YouCam)

Tech stack

Frontend: Expo SDK 54, React Native 0.81 (New Architecture), TypeScript

Backend: Supabase (auth, storage, postgres) + Cloudflare Workers (Perfect Corp proxy and Scan extraction)

AI / Vision: Perfect Corp YouCam APIs (try-on engine), GPT vision for Scan item extraction

Performance: try-on round trip under 8 seconds; Scan extraction about 15 seconds per TikTok

Build timeline (6 days, solo)

Day 1: Architecture, Expo project, Supabase schema, Perfect Corp API auth, first ring render end to end

Day 2: Feed, category chips, product page, photo sheet flow, body-photo storage per category

Day 3: Try-on routing across all six Perfect Corp endpoints, error and fallback states

Day 4: Scan flow. Worker pulls TikTok frames, GPT vision extracts items, web lookup returns matched products with confidence

Day 5: Saves drawer, bag, demo checkout, deep links out to brand sites

Day 6: Polish, copy, screen recording, submission

What's next

Two weeks: Invite-only TestFlight beta, partner with five fashion and jewelry brands for catalog seeding

One month: Public iOS launch, Shopify integration, creator program around Scan

Three months: Android, image-to-video try-on share clips, on-device caching for sub-second repeat renders

Submission contents

This zip contains:

OnMe_Submission.pdf this document (write-up + screenshots)

OnMe_demo.mov end-to-end demo video, ~2:55 (within the 1 to 3 minute requirement)

OnMe_voiceover.txt voiceover script that maps to the video

Winner exit interview: if selected, I confirm availability for the exit interview, blog feature, and questionnaire.
